

EXAM project 2015 (Energy-efficient Xhaul And M2M)

31 December 2015

The Energy-efficient Xhaul And M2M (EXAM) project has as overall target to provide solutions for the cellular access to deploy base stations and provide solutions for Machine type communication, while suggesting energy efficient communications.

Task 1, “Energy efficient networking”, will target this by devising means to decrease the network energy consumption.

This has the potential to provide both economic benefits in terms of reduced energy cost and operational expenditures (OPEX) for the network owners, as well as environmental benefits as reduced CO2 footprint from network operation.
